Mark Mysler

Backend Software Engineer (Python, AWS) | Co-founder & CEO, Punto Medio | Cybersecurity

Buenos Aires, Argentina | myslermark@gmail.com | +54 11 7369-4833 | linkedin.com/in/mark-mysler | github.com/markmysler

SUMMARY

Backend software engineer and co-founder and CEO of Punto Medio, a news-analysis platform I built on AWS with Python, PostgreSQL and LLMs. Two and a half years of freelance full-stack work for clients in Argentina and the US, including a public hospital. Computer Engineering student at Universidad de Belgrano, ISC2 Certified in Cybersecurity (CC), and a top-10 finalist at the UC Berkeley Innovation Intelligence Hackathon (2026). Native English and Spanish.

EXPERIENCE

Co-founder & CEO | Punto Medio | Buenos Aires, Argentina (Remote) | May 2025 – Present

Punto Medio (puntomedio.org) shows how different news outlets cover the same story, with every analysis backed by the exact source sentence. I lead the company and built most of the platform.

- Designed and built a serverless pipeline on AWS (Lambda, SQS, EventBridge, RDS PostgreSQL with pgvector, S3, CloudFront, Cognito) that collects and scrapes articles from dozens of Argentine outlets every 15 minutes.
- Built event clustering with embeddings and HDBSCAN, and LLM analysis of every article's framing, actors and claims, checked against the source text by an evaluation harness for neutrality and accuracy.
- Added entity linking to Wikidata, plus generated images and audio summaries for each event.
- Built the Next.js web app and admin console.
- Managed all infrastructure as code with Terraform, deployed by GitLab CI through OIDC with no stored cloud credentials.

Freelance Full-Stack Developer | Self-employed | Argentina (Remote) | Jul 2023 – Jan 2026

Built backends and full-stack web applications for clients in Argentina and the United States.

- AMVP APP: built the backend for a football statistics app for amateur players, a FastAPI REST API deployed with Docker behind Nginx, with Firebase and an Angular (PrimeNG) frontend.
- Hospital General de Agudos Dr. Juan A. Fernández: delivered two systems from requirements to deployment, a teaching-room booking platform (Django REST Framework, Vue 3) and a consulting-room scheduling system for doctors, rooms, shifts, leave and bookings, with an admin panel and data exports (Nuxt 4, Supabase).
- Iconic Virtual Offices (US): built a FastAPI backend with Keycloak authentication, PostgreSQL and WebSocket presence tracking, deployed with Docker Compose and Nginx; Node.js integrations with HubSpot and Zapier; Stripe checkout synced to the company's GoHighLevel CRM.

Robotics and Programming Teacher | TecnoKids LATAM | Greater Buenos Aires, Argentina | Mar 2025 – Mar 2026

- Taught programming and robotics to children aged 6 to 8, from first programs in Scratch to building and programming robots with LEGO and ESP32 microcontrollers.

English–Spanish Translator | ynet | Remote | Jan 2020 – Mar 2023

- Translated, edited and adapted news articles from English into Spanish for ynet's Spanish edition.

PROJECTS

- **Tenure** (UC Berkeley Innovation Intelligence Hackathon, top 10 finalist, Oct 2026): AI teams for solo founders that work in Telegram and earn autonomy one approved task at a time. Built with Juan Ignacio Llaberia using LangGraph, OpenRouter, Claude and Supabase.

- **Pathfinder** (markmysler.github.io/pathfinder): an interactive app where graph-search algorithms (BFS, Dijkstra, A*, contraction hierarchies and more) race across real OpenStreetMap streets, with an article for each algorithm. Offline-capable PWA in TypeScript, React, MapLibre and Web Workers, tested with Vitest and Playwright.
- **pokedex-next** (pokedex-next-rho.vercel.app): a Pokémon collection and battle game with real-time multiplayer, trading and case openings, in English and Spanish. All game logic runs server-side on a locked-down Supabase backend (row-level security, private Realtime channels, atomic PostgreSQL functions). Next.js, TypeScript.
- **Damn Vulnerable Containers** (github.com/markmysler/dvc): a self-hosted offensive-security training platform that runs intentionally vulnerable apps in isolated Docker containers for capture-the-flag practice. Flask, Docker, TypeScript.
- **wpair-cli** (github.com/markmysler/wpair-cli): a defensive scanner for CVE-2025-36911, a Google Fast Pair Bluetooth vulnerability. Python.

EDUCATION

- **Computer Engineering**, Universidad de Belgrano, Buenos Aires | Mar 2025 – 2029 (expected)
- **Professional Certificate in Artificial Intelligence**, Instituto Tecnológico de Buenos Aires (ITBA) | Apr 2024 – Jul 2024

CERTIFICATIONS

- ISC2 Certified in Cybersecurity (CC) | Oct 2024 (valid to Oct 2027)
- Fundamentals of Hacking and Defense (FOHD), Ekoparty Hackademy | Jan 2026

AWARDS

- Finalist (top 10), UC Berkeley Innovation Intelligence Hackathon, SCET and DECODE | Oct 2026
- Academic Excellence Award, Rotary Club Belgrano, for one of the best first-year grade averages in Computer Engineering at Universidad de Belgrano | Sep 2026

SKILLS

- **Languages:** Python, TypeScript, JavaScript, SQL, C#
- **Backend:** FastAPI, Django REST Framework, Flask, Node.js, REST APIs, WebSockets, Keycloak
- **Cloud and DevOps:** AWS (Lambda, SQS, EventBridge, RDS, S3, CloudFront, Cognito), Terraform, Docker, Docker Compose, Nginx, GitLab CI, GitHub Actions, Linux
- **Data and AI:** PostgreSQL, pgvector, Supabase, Firebase, Large Language Models (LLMs), LangGraph, embeddings, clustering (HDBSCAN), LLM evaluation
- **Frontend:** React, Next.js, Vue 3, Nuxt, Angular, Tailwind CSS
- **Security:** cybersecurity fundamentals, ethical hacking, vulnerability assessment, network security, authentication and access control
- **Integrations:** Stripe, HubSpot, Zapier, GoHighLevel
- **Testing:** Vitest, Playwright, pytest
- **Other:** project management, leadership, teaching
